

# Special Session

# From Subsea to Outer Space

## Signal processing and communication for extreme environments

Extreme environments such as underwater, outer space, high altitude, underground where human cannot survive more than few minutes without any protection equipment cause specific communication problems.

The attempts to solve problems resulting from isolation and different physical parameters combine the methods of communication and signal processing.

This special session will enable experts from diverse areas to exchange ideas, increase the recognizability of the sector and provide the opportunity to professionals and young researchers to get information about cutting edge technologies.
